Taking Care of Your New Leather Accessory

Thank you for your purchase!

Avoid Direct Moisture & Oils

Leather absorbs moisture such as water, and that can cause the leather to warp. In the event that it gets wet from water, let your item dry at room temperature and away from the sun. For other liquids follow the cleaning instructions below.

Oils will darken leather and as such it's recommended to avoid spraying perfume or cologne on leather.

Keep Away From Heat

Heat will cause leather to warp and potentially even burn. Thus, it's best to keep leather away from heating vents, flames, and ovens - and definitely not your dryer. Even long exposure to sun-light can cause damage.

If your leather warps or hardens due to heat, consult with a specialist to see if it can be repaired.

Clean Spills Immediately

Leather can (and will) stain very quickly - if you spill something on your item, do your best to dab and gently wipe it off immediately with an alcohol-free wet wipe or damp towel.

Letting a spill sit on your item can also cake up, especially if it is something thick- like a sauce. This can damage the top layer of the leather as well if scraped off when dry.

Don't Use Chemicals

Chemicals such as bleach, soaps, and alcohol will strip away the protective coating on your leather, leaving it even more prone to stains and warping. It also will lose its shine and color - which means that it will need to be re-dyed to reach its original color.

Condition Twice a Year

Leather is a natural material, and it needs some TLC from time to time. The usual recommendation is to apply a leather conditioner twice a year. Some conditioners may darken leather but other conditioners exist that will reduce darkening. Leather conditioner is not the same as leather oil, which is much more potent and will typically darken your leather.
